

Main Points/Key Points	Notes
	<p style="text-align: center;">ES6 Features</p> <p>1. Arrow Functions.</p> <ol style="list-style-type: none"> It is a new way of writing a compact function. Developers called them as <i>lambda</i> or <i>fat arrow</i> functions. Arrow functions eliminate the use of <i>function</i> and <i>return</i> keywords for shorter syntax. There are few ways to declare a function in JavaScript ES5, these include <i>function declaration</i>, <i>expression</i>, <i>named</i> and <i>object</i>. Examples: <div data-bbox="727 792 1362 1487" style="border: 1px solid black; padding: 10px; margin: 10px 0;"> <p style="text-align: center;">ES5 Functions</p> <pre> // Function Declaration function sum(x,y){ return x+y; } // Function Expression let sum = function(x,y){ return x+y; } // Named Function Expression let sum = function sum(x,y){ return x+y; } // Function Object function car(model, manufacturer){ this.model = model; this.manufacturer = manufacturer; } </pre> </div>
	Summary

Main Points/Key Points	Notes
	<p style="text-align: center;">ES6 Features</p> <p>e. In ES6, function expression is used to represent the arrow function together with => operator.</p> <p>f. Examples:</p> <div data-bbox="727 492 1362 844" style="border: 1px solid black; padding: 10px; margin: 10px 0;"> <p style="text-align: center;">ES6 Arrow Functions</p> <pre> let sum = (x,y) => {return x+y}; let sum = (x,y) => x+y; //both are identical or implicit //return let sum = () => x+y; let sum = x => x+10; let sum = (x = 10) => x+y; let sum = (x = 10, y = 23) => x+y; </pre> </div> <p>g. Arrow functions are NOT suitable for <i>Object Methods</i> and <i>Constructors</i>.</p> <p>h. Example:</p> <div data-bbox="727 1032 1362 1603" style="border: 1px solid black; padding: 10px; margin: 10px 0;"> <p style="text-align: center;">ES6 Method & Constructor</p> <pre> let car = (model, manufacturer) =>{ this.model = model; this.manufacturer = manufacturer; } var myCar = new car(); // Not a constructor let car = { manufacturer: 'Honda', display: () => { console.log(this.manufacturer); } } car.display() // undefined </pre> </div>
	<p>Summary</p>

Main Points/Key Points	Notes
	<div><div>ES6 Features</div><div><div>i. Arrow functions are useful for returning an <i>object</i>.</div><div>j. Example:</div><div><div>ES6 Return An Object</div><div><pre>const getInfo = () => ({ name: 'Hassan Basri', company: 'Google', job: 'Data Engineer', }); getInfo(); // return { name: 'Hassan Basri', company: 'Google', job: 'Data Engineer' }</pre></div></div><div><div>2. Template String (Literal).</div><div><div>a. It allows developers to write or display an output with dynamic contents.</div><div>b. It removes the need for “+” operator to concatenate or join multiple strings.</div><div>c. It uses back ticks (<code>`</code>) to define the string and pass the variable with <code>\${ }</code> template.</div><div>d. Example:</div><div><div>ES Template String</div><div><pre>const total = (x, y) => { return `Total, \${x+y}! Reduce \${x-y}?`; };</pre></div></div></div></div></div></div>
	Summary

Main Points/Key Points	Notes
	<div>ES6 Features</div> <div>3. For of Loop</div> <div><div>a. It is similar to for in and for loop in ES5 but with compact declaration.</div><div>b. Example:</div><div><div>ES6 For of Loop</div><div>let arr = [2,3,4,1]; for (let value of arr) { console.log(value); } Output: 2 3 4 1 let string = "Javascript"; for (let char of string) { console.log(char); } Output: J a v a s c r i p t</div></div></div>
	Summary

Main Points/Key Points	Notes
	<div>ES6 Features</div> <div>4. Object Destructuring.</div> <div><div>a. It allows developers to break down or select useful information from an object.</div><div>b. The selected information is assigned to predefined variables.</div><div>c. It is useful for object and array.</div></div> <div><div>ES6 Object Destructuring</div><pre>const info = { name: 'Spencer', company: 'Handlebar Labs', location: { city: 'Nashville', state: 'Tennessee', }, }; const { name, location } = info; const { city, state } = location; console.log(name); // name is Spencer Console.log(city); // city is Nashville</pre></div>
	Summary

Main Points/Key Points	<div data-bbox="967 197 1046 230">Notes</div> <div data-bbox="911 271 1102 304">ES6 Features</div> <div data-bbox="580 380 845 421">5. Object Spread.</div> <div data-bbox="678 421 1437 568"><div>a. It allows developer to copy one object to another.</div><div>b. It mostly used in React Native and represented with (...) symbol to copy the existing object.</div><div>c. Example:</div></div> <div data-bbox="727 604 1362 1361"><div data-bbox="911 609 1177 642">ES6 Object Spread</div><pre data-bbox="740 678 1302 1330">const handlebarLabsInfo = { company: 'Handlebar Labs', location: { city: 'Nashville', state: 'Tennessee', }, }; const spencerInfo = { ...handlebarLabsInfo, name: 'Spencer', } console.log(spencerInfo); // { name: 'Spencer', company: 'Handlebar Labs', location: { city: 'Nashville', state: 'Tennessee' } }</pre></div>
	<div data-bbox="940 1547 1072 1581">Summary</div>

Main Points/Key Points	Notes
	<div>ES6 Features</div> <div>6. Classes.<div><div>a. It is a special function and a better way to define an object in JavaScript.</div><div>b. It allows developer to define an object in clean and Java like syntax.</div><div>c. Example:<div><div>ES6 Classes</div><div><pre>class People { constructor(name) { this.name = name; } get Name() { return this.name; } set Name(name) { this.name = name; } } let person = new People("Jon Snow"); console.log(person.Name); person.Name = "Dany"; console.log(person.Name);</pre></div></div></div></div><div>d. The class definition allows inheritance or subclass similar to Java.</div></div>
	Summary

Main Points/Key Points	Notes
	<div>ES6 Features</div> <div>7. Modules.</div> <div><div>a. Experimental modules in JavaScript contain:</div><div><div>i. import allows developers to use or call exported functions, objects and primitive values.</div><div>ii. export allows developers to distribute functions, objects, and primitive values to be called by another page or file.</div><div>iii. This requires node.js experimental modules.</div><div>iv. Compile with node --experimental-modules import.mjs</div></div><div>b. Example:</div><div><div><div>Export.mjs</div><div>let func = a => a + a; let obj = {}; let x = 0; export { func, obj, x }; // or export default class obj {...}</div></div><div><div>Import.mjs</div><div>import { func, obj, x } from './Export.mjs'; console.log(func(3), obj, x); // or import obj from './Export.mjs';</div></div></div></div>
	Summary

Main Points/Key Points	Notes
	<div>ES6 Features</div> <div><div>c. Nonexperimental or mostly used modules in JavaScript contain:<div><div>i. require allows developers to use or call exported functions, objects and primitive values.</div><div>ii. module.exports allows developers to distribute functions, objects, and primitive values to be called by another page or file.</div></div></div><div>d. Example:</div><div><div><div>Export.js</div><div>let func = a => a + a; let obj = {}; let x = 0; module.exports = { func, obj, x };</div></div><div><div>Import.js</div><div>const myimport = require('./Export.js'); console.log(myimport.func(3), myimport.obj, myimport.x);</div></div></div></div>
	Summary

Main Points/Key Points

Notes

ES6 Features

8. Callbacks and Promises.

- a. A callback function is used to call another function when its execution is completed.
- b. A callback function is passed as an argument or parameter in the function.
- c. For example:

Callback Function

```
setInterval(function(){  
  console.log('hi')  
},3000);  
  
setInterval(() => console.log('hi'),3000);
```

- d. Promises are series of continuation events for **multiple async operations**. This will solve multiple callbacks within the same function.
- e. For example:

Promises

```
let promise = new Promise(function(resolve,  
reject) {  
  setTimeout(() => resolve("done!"), 1000);  
});  
  
// resolve runs the first function in .then  
promise.then(  
  result => alert(result), // shows "done!"  
  after 1 second  
  error => alert(error) // doesn't run  
);
```
